Patent Pending

UNIKON Broiler Feeder

An innovative standard in broiler feeding technology

What the **UNIKON Feeder** has to offer

The Unikon Feeder is designed ONLY to allow small chicks to stand around the outside of the feeders while eating.

Patented design of waving ring at the feeder pan prevents usual feed waste.

During partial house brooding, up to 8 feeder pans can be set up per every 10 feet of brooding area.

Once the brooding period is over, the feeders will be moved back to their original location. This is made possible by the patented design of the feeder, eliminating the need for additional manual chick feeders.

At the chick stage, the feeder is designed with a low pan height and a high feed level to provide easy access for chicks.

At Grower-stage the pan drops to a low feed level to minimize feed waste.

The feeder also features a microswitch for consistent feed control at the end-control-pan with an LED light.

Optional:
Paired with a proximity sensor that stops the feed line at any pan along the line.
